

SECURECLOUD 2.0 - SIMPLE & EASY SOC GUIDE

How Correlation, SOAR Policies & User Risk Matrix Work with Real Examples

QUICK OVERVIEW: WHAT IS THE DIFFERENCE?

Section	Simple Analogy	What It Does	Main Button Admin Clicks
1. Threat Correlation (/admin/correlation)	The Detective ■■■■■	Connects different clues (IPs + virus files + failed logins) into one big attack cluster.	'Execute Mitigation' (Bans IP, quarantines files, revokes links)
2. SOAR Policies (/admin/policies)	The Automatic Alarm / Sprinkler ■	Automatic rules: IF virus uploaded > 2, THEN immediately isolate and sound alarm.	'Test / Execute' (Runs the automatic defense rule instantly)
3. Risk Matrix (/admin/risk-profiling)	The Employee Safety Score ■	Gives every user a risk score (0-100). Flags hacked or careless accounts.	'Enforce 2FA' or 'Lockdown User'

1. ■ THREAT INTELLIGENCE CORRELATION ENGINE

In Simple Words: If an attacker tries to hack the system, they don't just do one thing. They might upload a bad file, try passwords, and share links. The Correlation Engine gathers all these clues from different users and IPs and puts them together into a **Threat Cluster**.

REAL-WORLD EXAMPLE SCENARIO:

- **Step 1 (Attack):** An attacker from Russia (IP: 198.51.100.42) uploads a fake PDF named invoice.pdf.exe into User 17's account.
- **Step 2 (Exfiltration):** The attacker generates a public share link to spread the file to other employees.
- **Step 3 (Correlation):** SecureCloud notices: same bad IP + double-extension virus + active share link. It creates **THREAT CLUSTER #0042**.
- **Step 4 (Admin Action):** Admin opens /admin/correlation, sees the 92% Danger Cluster, and clicks **'Execute Mitigation'**.
- **Step 5 (What Happens Immediately):**
 1. Attacker's IP 198.51.100.42 is permanently banned in IP Guard.
 2. invoice.pdf.exe is locked into Quarantine Vault.
 3. The public share link is destroyed so no one can download it.
 4. Cluster status changes live to **MITIGATED & RESOLVED (0% Threat)**.

2. ■ SOAR AUTOMATED RESPONSE POLICIES

In Simple Words: SOAR stands for *Security Orchestration, Automation, and Response*. It is like a smart home security system. You give it rules: **'IF something dangerous happens, THEN take action in 0.1 seconds without waiting for human approval.'**

Rule Name	IF (Trigger Condition)	THEN (Automatic Reaction)
-----------	------------------------	---------------------------

Rapid Malware Ingress Containment	Someone uploads 2 or more virus files within 10 minutes.	1. Quarantine all virus files immediately. 2. Revoke all active public share links. 3. Sound the military breach alarm on admin navbar.
Brute Force IP Containment & Ban	5 failed login attempts occur from the same IP address in 5 minutes.	1. Blacklist the IP address in IP Guard. 2. Terminate any active sessions from that IP. 3. Create a high-priority security audit log.
Suspicious Anomaly Escalation	A user account uploads 3 suspicious files.	1. Enforce Two-Factor Authentication (2FA) on the user. 2. Send an alert to SOC Admin. 3. Increase user risk score.

How Admin Uses /admin/policies: Click **'Test / Execute'** to manually test any policy anytime. The execution counter increments and saves to the history log.

3. ■ USER RISK PROFILING MATRIX

In Simple Words: Gives every user a Safety Score from 0 to 100 so the Admin instantly knows who is safe and who is at risk.

CRITICAL (85-100) ■ Account has uploaded malware or is being brute-forced.	HIGH (50-84) ■ Multiple suspicious files or unencrypted public links.	MEDIUM (25-49) ■ Occasional failed logins or missing 2FA.	LOW (0-24) ■ Clean files, active 2FA, normal behavior.
--	---	---	--

HOW ADMIN RESPONDS TO A HIGH-RISK USER:

- **Example:** User *'Rahul'* has Risk Score **88/100 (CRITICAL)** because his account uploaded a virus and had 4 failed logins.
- **Action 1 - Click 'Enforce 2FA':** The system immediately locks the requirement for 2FA. Next time Rahul logs in, he must use Google Authenticator/TOTP. His risk score drops by 20 points.
- **Action 2 - Click 'Lockdown User':** If the admin suspects Rahul's account is currently being hacked, clicking Lockdown severs all open browser sessions, cancels his links, and prevents login until admin re-enables it.

4. ■ CONFIDENTIAL VAULT LOCKOUT COUNTDOWN

- **Wrong PIN 1 & 2:** Warning message: *'Incorrect PIN. Only 1 attempt remaining!'*
- **Wrong PIN 3:** File locks for **30 minutes**. A live ticking clock (29m 45s remaining) appears at the side of the file.
- **Wrong PIN 6:** File locks for **2 hours** (01h 59m 50s remaining).
- **Wrong PIN 9: Permanently Locked.** Decryption key is permanently destroyed to protect private data from brute force.
- **When timer reaches 00:00:** Input automatically unlocks so the user can enter the correct PIN.
